Engine Cooling Fans - Advance Auto Parts Engine Cooling Fan - Basic Function. Running a car engine creates a tremendous amount of heat and stress. To prevent the internal temperature from reaching dangerous levels (dangerous for both you and your automobile), the coolant fan helps distribute liquid and gas coolant throughout the engine.

The engine cooling fan is designed to move air through the radiator when the vehicle is at slower speeds or stopped. This air flow removes heat from the coolant created by the engine using the radiator as a conductor. An engine cooling fan is temperature controlled to only run when needed.

How Radiator Cooling Fans Work Explained in Under 5 Minutes

On most modern cars, the cooling fan is controlled by the Engine Control Unit (ECU) which gets a signal from the coolant temperature

sensor. If it's not working, the fan won't turn on when it needs to, which means the engine might overheat.

Defective fan relay. The fan relay controls the power to the cooling fan.

Car cooling fan problems and how to check it | The AA Engine Cooling Fan The fan will then cycle on and off as needed to maintain the proper coolant temperature. So, The fan runs mostly at idle or low speed when the engine is at normal temperature. Most fans should come on when the coolant reaches about 200 to 230 degrees.

Engine Cooling Fan - Is Yours Working - How To Test It

Rear-wheel drive cars with longitudinal engines usually have engine-driven cooling fans. These fans have a thermostatically controlled viscous clutch. This clutch is positioned at the hub of the fan, in the airflow coming through the radiator. This special viscous clutch is much like the viscous coupling sometimes found in all-wheel drive cars.

electric cooling fans to help pull air through the radiator so that it can keep the engine cool. Most cooling fans use electric motors that have a moderate to high current draw, and as a result are commonly controlled using relays. The cooling fan relay is the relay that controls the engine's cooling fans. When the correct parameters are met, a temperature switch or the computer will activate the relay, which will allow power to the fans.

A car engine produces a lot of heat when it is running, and must be cooled continuously to avoid engine damage. Generally this is done by circulating coolant liquid usually water mixed with an antifreeze solution through special cooling passages.
