One of the great aircraft of the Cold War era, the McDonnell Douglas F-4 Phantom II was the most heavily produced supersonic, all-weather fighter bomber. Capable of a top speed of Mach 2.23, it set sixteen world records including an absolute speed record of 1,606 mph and an altitude record of 98,557 feet. The F-4 flew Vietnam, in the Arab-Israeli conflict, and the Gulf War and amassed a record of 393 aerial victories. F-4s also flew as part of the USAF Thunderbirds and the U.S. Navy Blue Angels flight demonstration teams. Originally printed by McDonnell and the U.S. Navy in the 1960s, this flight operating handbook taught pilots everything they needed to know before entering the cockpit. Classified "restricted", the manual was recently declassified and is here reprinted in book form. This affordable facsimile has been reformatted. Care has been taken however to preserve the integrity of the text.

Microsoft Word has grown considerably in power, sophistication and capability over the past decade, but one thing that hasn't changed since the early '90s is its user interface. The simple toolbar in version 2.0 has been packed with so many features since then that few users know where to find them all. Consequently, more and more people are looking for "insider" tips that will allow them to use these advanced and often hidden features. Microsoft has addressed this problem in Word 2007 by radically redesigning the user interface with a tabbed toolbar that makes every feature easy to locate and use. Unfortunately, Microsoft's documentation is as scant as ever, so even though you will be able to find advanced features, you might not know what to do with them. Word 2007: The Missing Manual, written specifically for this version of the software, explains basics like how to create documents, enter and edit text, format, print, and fax. You will also learn how to create sophisticated page layouts, insert forms and tables, use graphics, and create book-length documents with outlines and Master Documents.
