Most of the disease-causing fungi are opportunistic pathogens, meaning they only cause disease under certain circumstances ? such as when the immune system becomes weakened. For example, chemotherapy , immunosuppressive drugs and HIV infection all result in an impaired immune system , meaning that fungi can then more easily infect these vulnerable patients.

T-cell-mediated immunity seems essential for recovery both from cutaneous and mucosal infections (Candida, Malassezia and dermatophytes) and from infections of systemic fungal pathogens (Cryptococcus, Blastomyces, Histoplasma, and Coccidioides). Often chronic progressive disease caused by these fungi is associated with a depression or absence of T-cell-mediated immunity to antigens of the infecting fungus.

Immunology of fungal infections in animals.

Candida albicans is a normal part of the human commensal flora, however it is also the most common fungal species that can cause human disease. C. albicans causes multiple types of infections but they can be broadly divided into two groups: mucosal and systemic. Mucosal infections present commonly in otherwise healthy women as vulvovaginal candidiasis (thrush), which up to 75% adult women will experience at least once in their life time. C. albicans can also colonise the mouth (oral ...
