Inert Gas System (IGS) on a ship refers to a system deployed for prevention of an explosion in the cargo tanks of a tanker. In this integrated system, while pumping out the liquid inflammable cargo, an inert gas (sometimes by flue gas from ship boilers) is also pumped in. An oil tanker's job is to carry different

What Is An Inert Gas System (IGS) On Ships & Tankers

Every Inert gas system Is required to be fitted with one or more pressure/vacuum breakers or other approved devices. These are designed to protect the cargo tanks against excessive pressure or vacuum and must, therefore, be kept in good working order by regular maintenance in accordance with the manufacturer's Instructions.

Inert Gas on board Tankers - All you need to know!

Inert gas system. An oil tanker's inert gas system is one of the most important parts of its design. Fuel oil itself is very difficult to ignite, however its hydrocarbon vapors are explosive when mixed with air in certain concentrations. The purpose of the system is to create an atmosphere inside tanks in which the hydrocarbon oil vapors cannot ...

Inert gas system A system of preventing any explosion in the cargo tanks of a tanker by replacing the cargo, as it is pumped out, by an inert gas, sometimes by flue gas from ship boilers. Gas freeing must be carried out subsequently if workers have to enter the empty tanks.

Inert gas system - Encyclopedia

Inert gas systems on ships. Inert gas is produced on board crude oil carriers (above 8,000 tonnes)(from Jan 1, 2016) by using either a flue gas system or by burning kerosene in a dedicated inert gas generator. The inert gas system is used to prevent the atmosphere in cargo tanks or bunkers from coming into the explosive range.

Over the last three decades the process industries have grown very rapidly, with corresponding increases in the quantities of hazardous materials in process, storage or transport. Plants have become larger and are often situated in or close to densely populated areas. Increased hazard of loss of life or property is continually highlighted with incidents such as Flixborough, Bhopal, Chernobyl, Three Mile Island, the Phillips 66 incident, and Piper Alpha to name but a few. The field of Loss Prevention is, and continues to, be of supreme importance to countless companies, municipalities and governments around the world, because of the trend for processing plants to become larger and often be situated in or close to densely populated areas, thus increasing the hazard of loss of life or property. This book is a detailed guidebook to defending against these, and many other, hazards. It could without exaggeration be referred to as the "bible" for the process industries. This is THE standard reference work for chemical and process engineering safety professionals. For years, it has been the most complete collection of information on the theory, practice, design elements, equipment, regulations and laws covering the field of process safety. An entire library of alternative books (and cross-referencing systems) would be needed to replace or improve upon it, but everything of importance to safety professionals, engineers and managers can be found in this all-encompassing reference instead. Frank Lees' world renowned work has been fully revised and expanded by a team of leading chemical and process engineers working under the guidance of one of the world's chief experts in this field. Sam Mannan is professor of chemical engineering at

Texas A&M University, and heads the Mary Kay O'Connor Process Safety Center at Texas A&M. He received his MS and Ph.D. in chemical engineering from the University of Oklahoma, and joined the chemical engineering department at Texas A&M University as a professor in 1997. He has over 20 years of experience as an engineer, working both in industry and academia. New detail is added to chapters on fire safety, engineering, explosion hazards, analysis and suppression, and new appendices feature more recent disasters. The many thousands of references have been updated along with standards and codes of practice issued by authorities in the US, UK/Europe and internationally. In addition to all this, more regulatory relevance and case studies have been included in this edition. Written in a clear and concise style, *Loss Prevention in the Process Industries* covers traditional areas of personal safety as well as the more technological aspects and thus provides balanced and in-depth coverage of the whole field of safety and loss prevention. - A must-have standard reference for chemical and process engineering safety professionals - The most complete collection of information on the theory, practice, design elements, equipment and laws that pertain to process safety - Only single work to provide everything; principles, practice, codes, standards, data and references needed by those practicing in the field

Ship Construction is a comprehensive text for students following BTEC courses in nautical science, naval architecture and shipbuilding, and courses leading to BSc (Nautical Science) or Extra Masters Certificate. The author presents seven sections that begin with an introduction to ship building and conclude with the finished product. There is a concise description of all the relevant international regulations. The seven sections cover the development of ship types, materials and strengths of ships, welding and cutting, shipyard practice, ship structure and outfitting. Each section is broken down into several chapters that explore the topics in depth. The fifth edition expands further on the development of

ship types over the last few years - discussion focussing on the latest views on bulk carrier safety. Welding and shipyard practices have been reviewed and revised in line with current practice. In addition, the book covers all the latest IMO and SOLAS information. Follows, chapter by chapter, the construction of a ship from start to finish. IMO and SOLAS: latest information covered. Essential for both nautical students and professional students of naval architecture.

The Condition Assessment Scheme (CAS) for oil tankers was adopted in 2001 and is applicable to all single-hull tankers of 15 years or older. Although the CAS does not specify structural standards in excess of the provisions of other IMO conventions, codes and recommendations, its requirements stipulate more stringent and transparent verification of the reported structural condition of the ship and that documentary and survey procedures have been properly carried out and completed. The Scheme requires that compliance with the CAS is assessed during the Enhanced Survey Program of Inspections concurrent with intermediate or renewal surveys currently required by resolution A.744(18), as amended.--Publisher's description.
